SharePoint Intake Artifacts: EDA for IDP Theme Gen

Summary

Theme Gen can reach 90% of ERs only if it reads beyond the "Finalized Artifacts" folder. A Finalized-only rule reaches 20%.

- **Inventory:** 782 ERs, 4,199 files, 19.6 GB. The median ER has 4 files (average 5.7). 48 ERs (6%) are empty.
- **Folder convention is not followed consistently:** only 27% of ERs with files have a Finalized folder, and 46% use neither Finalized nor Working.
- **Coverage by folder rule:** if Theme Gen reads only Finalized folders, it finds usable documents for 20% of ERs; Finalized plus Working, 46%; every folder, 90%. With Finalized only, 545 ERs would fall back to Planview even though they have usable documents in other folders.
- **Key documents:** no file is named "Value Card"; Idea Cards appear by name in 89 ERs (11%), Candidate Architecture (CA) in 92, Data Architecture (DA) in 25. These counts come from matching file names, and short labels like "CA" also match unrelated names, so they need a manual spot-check.
- **Tokens:** extracted text per ER is small (median about 3K to 5K tokens, 90th percentile about 10.5K), well under the 24K-token limit. Images are not counted, and they are common in CA/DA documents.

Recommendation: read all folders in priority order (Finalized, then Working, then root), exclude Excel, and fall back to Planview only for the 79 ERs with no in-scope files.

Scope

The EDA covers the 02 Intake Artifacts SharePoint library, where each top-level folder is one ER (Planview Work Entry). In-scope documents follow the business guidance for IDP Theme Gen.

	Document types
Needed	Value Card / Value Case (replaces Idea Card), Candidate Architecture (CA), Data Architecture (DA), supporting files such as kickoff slides and notes, including images

	Document types
Not needed	Gate 0 and Gate 1 estimate workbooks (ClassicHEM / SlimHEM), Stakeholder Engagement Workbook, Bill of Materials (BOM), all Excel files

The EDA was done in two steps:

1. **Metadata inventory (every file):** listed the name, type, size and folder of every file in every ER, without opening any file.
2. **Content sample (100 files):** opened 100 in-scope files from 81 ERs to measure their text, tokens and images. Files were picked across document types, file types and folders so each kind is represented.

Of the 4,199 files, 2,369 are types Theme Gen needs (not Excel, and not Gate estimates, Stakeholder Engagement Workbooks or BOMs). Those 2,369 files are spread across 703 of the 782 ERs.

Inventory

ERs are small and storage is dominated by PowerPoint. The metadata pass covered 1,797 folders with 0 listing failures.

Files per ER (734 ERs with files; 48 more are empty)

Median	Mean	90th percentile	Max
4	5.7	10	148 (0102678 Evolent Cancer Services)

File types

Category	Extensions	Files	In scope
Spreadsheets	.xlsm, .xlsx, .xls, .xlsb, .csv	1,616	No
Presentations	.pptx, .ppt, .odp	1,361	Yes
Emails	.msg, .eml	567	Not named by the business; included for now
PDF	.pdf	401	Yes
Word	.docx, .dotx, .doc, .docm	221	Yes

Category	Extensions	Files	In scope
Images, archives, Visio, OneNote	.png, .jpg, .webp, .zip, .vsdx, .vsd, .one	33	Images yes; others not parsed

File size: median 0.51 MB, 90th percentile 12.1 MB, largest 60.2 MB. PowerPoint is 79% of storage, mostly from embedded media.

Folder structure and coverage

The Finalized / Working convention is used by a minority of ERs, so a Finalized-only rule would miss most documents.

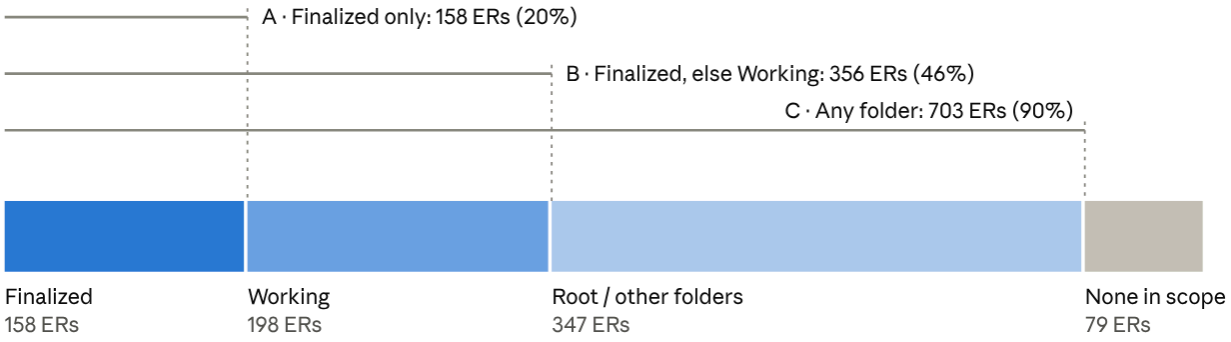

How ERs use the two folders (734 ERs with files)

Structure	Share of ERs
Neither folder	46.0%
Working only	27.1%
Finalized only	17.3%
Both	9.5%

By file count, 46% of files (and 70% of storage) sit outside both folders.

Reading all folders reaches 90% of ERs; Finalized only reaches 20%

782 ERs, grouped by the highest-priority folder that holds an in-scope file

eda2_coverage.csv and eda2_policy_c_tier_by_er.csv · 782 ERs

Each line marks how far a folder rule reaches. The 347 ERs whose documents sit only at the root or in other folders are reached only by rule C; the 79 with nothing in scope (including 48 empty ERs) fall back to Planview.

Under rule A, 624 ERs fall back to Planview, and 545 of them have in-scope documents elsewhere.

Depth: Finalized folders are nearly flat (486 files at depth 0, 88 at depth 1, 8 at depth 2). Working goes deeper (622, 454, 71, and 12 at depth 3 or more), so full recursion is cheap. The most common subfolder name is Archive (34 subfolders); what they contain was not measured.

Document types and identifiers

Key documents can be found by file name for a minority of ERs; abbreviations like "VC", "CA" and "DA" are rarely used on their own.

Document	Files	ERs	Notes
Value Card or Idea Card (by name)	173	89 (11%)	Counts only names containing "value card" or "idea card"; bare "VC" labels are excluded. All 173 are Idea Cards. "Value Case" (the business's example name) appears in 134 files / 99 ERs and is not counted.
Candidate Architecture (CA)	123	92	Loose matching found 207 files / 143 ERs
Data Architecture (DA)	41	25	Loose matching found 59 files / 42 ERs

Why these need a manual check: the counts come from matching words in file names, not from reading the files. A loose rule overcounts, because "CA" or "DA" can appear in names that are not architecture documents. A strict rule undercounts: it dropped plausible names like "CA Doc", "CA Diagram" and "DA Ver". The true counts sit between the two; reviewing 75 sampled names (25 per type) will settle which rule to use.

Naming conventions found

- ER folders: `Work ID_Work Entry Name` or `Work ID - Work Entry Name`, with a 7-digit ID starting `010` (sometimes prefixed `I` or `2026_`).
- A second format: `I` plus 8 digits and a project ID `P` plus 8 digits, with `P000XXXXX` as a placeholder (for example `2026_I00018802_P000XXXXX_VC`).
- Template files use placeholder IDs (`I0000000`, `I000000`) and should be excluded.
- ClassicHEM / SlimHEM workbooks are Gate 0/1 estimates, not value cards.

Tokens (text only)

With Excel out of scope, most ERs' extracted text fits in a single prompt; only a long tail needs special handling.

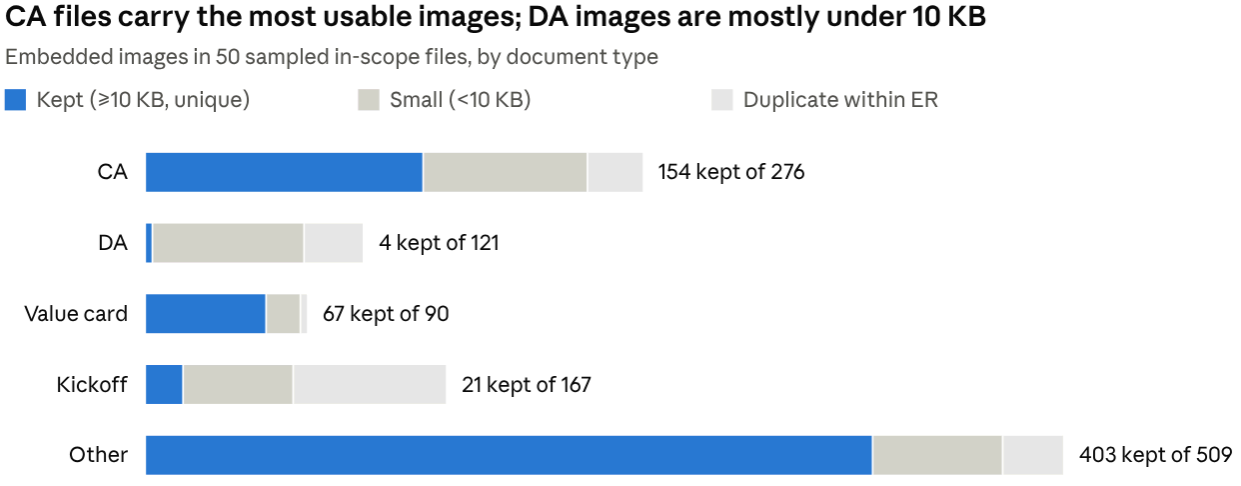

Folder rule	Median per ER	90th percentile	Max
A: Finalized only	4,538	10,402	44,838
C: Any folder	2,824	10,544	123,472

Tokens are counted with tiktoken `cl100k_base` on extracted text, and per-ER totals are projected from the 100-file sample. Rule C has a lower median because it adds many ERs with only one or two small files. Images are excluded; see Images.

Threshold: the existing 24K-token limit fits most ERs. The 90th percentile is about 10.5K under either rule, so at least 90% of ERs are under it. Only the tail exceeds it (largest ER: 44.8K under rule A, 123.5K under rule C), and those ERs need priority ordering or trimming. Image tokens, if added later, would raise these totals.

Images

Embedded images are common, especially in architecture documents: 10 of 12 sampled CA files and 6 of 6 DA files contain them.

eda2_image_detail.csv · 50 sampled .pptx, .docx and .pdf files

Across 50 sampled .pptx, .docx and .pdf files there were 1,163 images.

- **Kickoff:** files with "kickoff" in the name, the kickoff slides the business listed. **Other:** in-scope files that match no named type, such as general decks, PDFs, Word documents and emails.

- **10 KB cutoff:** a rough filter, not a validated one. Images under 10 KB are usually icons, bullets and logos, but vector diagrams (EMF, SVG) can also be small, which may be why most DA images fall below it.
- **Duplicates** were only checked within each ER, so logos and template graphics repeated across ERs are still in the kept count, especially under Other.

Only one sampled slide was image-only, so OCR is not a significant need.

Image handling (captioning at ingestion vs. direct vision input) and its token cost are a design decision for the next phase.

Recommendations

1. **Read all folders in priority order:** Finalized, then Working, then root or other folders, keeping the highest-priority copy when files repeat. This reaches 90% of ERs versus 20% for Finalized only.
2. **Open question: should Theme Gen read nested subfolders?** Some documents sit below the top level: 96 files in Finalized and 537 in Working are one or more levels down (12 are 3 or more). The most common subfolder name is Archive (34), and its contents haven't been checked. Options: read all subfolders, read all except Archive, or read only the top level. Blank template files with placeholder IDs (I0000000) can be skipped either way.
3. **Exclude Excel and the not-needed types** (Gate 0/1 estimates, Stakeholder Engagement Workbook, BOM).
4. **Fall back to Planview Work Entry details** only for the 79 ERs with no in-scope files.
5. **Don't depend on file names to find value cards.** Today no file is named "Value Card", and Idea Cards appear in only 89 ERs (11%), and there is no evidence that future files will be named consistently. Identify them by their content, compared against the Value Case template, once more examples arrive.
